<b>Report Date</b>	February 16, 2022

## About MetaStellar

Meta Stellar is a project with the ability to utilize the power of the blockchain and decentralization enables the crypto and DeFi community with a suite of powerful decentralized services available on the metaverse.

# Audit Summary

InterFi team has performed a line-by-line manual analysis and automated review of the smart contract. The smart contract was analyzed mainly for common smart contract vulnerabilities, exploits, and manipulation hacks. According to the smart contract audit:

- ❖ MetaStellar's solidity source code has **LOW RISK SEVERITY**
- ❖ MetaStellar's smart contract has an **ACTIVE OWNERSHIP**
- ❖ Important owner privileges – **BLACKLIST, AIRDROP, MAX TX & WALLET LIMIT, SET FEES, SET FEE MULTIPLIER, SET SWAP SETTINGS, SET TRADING STATUS**
- ❖ MetaStellar's smart contract owner has multiple "Write Contract" privileges. Centralization risk correlated to the active owner is **HIGH**

Be aware that smart contracts deployed on the blockchain aren't resistant to internal exploit, external vulnerability, or hack. For a detailed understanding of risk severity, source code vulnerability, functional hack, and audit disclaimer, kindly refer to the audit.

🔴 Token Contract address: **0x7885e4fc89C43bc1f8440dc28d804c1E6281146c**

# Audit Scope

InterFi was consulted by MetaStellar to conduct the smart contract security audit of their solidity source code. The audit scope of work is strictly limited to the mentioned solidity file(s) only:

❖ MetaStellar.sol

## **Solidity Source Code On Blockchain (Verified Contract Source Code)**

<https://bscscan.com/address/0x7885e4fc89c43bc1f8440dc28d804c1e6281146c#code>

Contract Name: METASTELLAR

Compiler Version: v0.8.9

Optimization Enabled: Yes with 9999 runs

## **Solidity Source Code On InterFi GitHub**

<https://github.com/interfinetwork/audited-codes/blob/main/MetaStellar.sol>

## **SHA-1 Hash**

Solidity source code is audited at hash #92662a156c1af2103ed7e40e4a896c1bd4e0ea3d

# Audit Methodology

The scope of this report is to audit the smart contract source code of MetaStellar. InterFi has scanned the contract and reviewed the project for common vulnerabilities, exploits, hacks, and back-doors. Below is the list of commonly known smart contract vulnerabilities, exploits, and hacks:

## Category

---

### Smart Contract Vulnerabilities

- ❖ Re-entrancy
- ❖ Unhandled Exceptions
- ❖ Transaction Order Dependency
- ❖ Integer Overflow
- ❖ Unrestricted Action
- ❖ Incorrect Inheritance Order
- ❖ Typographical Errors

### Requirement Violation

- ❖ Ownership Takeover
- ❖ Gas Limit and Loops

### Source Code Review

- ❖ Deployment Consistency
- ❖ Repository Consistency
- ❖ Data Consistency
- ❖ Token Supply Manipulation
- ❖ Access Control and Authorization
- ❖ Operations Trail and Event Generation

### Functional Assessment

- ❖ Assets Manipulation
- ❖ Liquidity Access

## **InterFi's Echelon Audit Standard**

The aim of InterFi's "Echelon" standard is to analyze the smart contract and identify the vulnerabilities and the hacks in the smart contract. Mentioned are the steps used by ECHELON-1 to assess the smart contract:

1. Solidity smart contract source code reviewal:
  - ❖ Review of the specifications, sources, and instructions provided to InterFi to make sure we understand the size, scope, and functionality of the smart contract.
  - ❖ Manual review of code, which is the process of reading source code line-by-line to identify potential vulnerabilities.
2. Static, Manual, and Software analysis:
  - ❖ Test coverage analysis is the process of determining whether the test cases are covering the code and how much code is exercised when we run those test cases.
  - ❖ Symbolic execution is analyzing a program to determine what inputs cause each part of a program to execute.
3. Best practices review, which is a review of the smart contracts to improve efficiency, effectiveness, clarify, maintainability, security, and control based on the established industry and academic practices, recommendations, and research.
4. Specific, itemized, actionable recommendations to help you take steps to secure your smart contracts

## **Automated 3P frameworks used to assess the smart contract vulnerabilities**

- ❖ Slither
- ❖ Consensys MythX, Mythril
- ❖ SWC Registry
- ❖ Solidity Coverage
- ❖ Open Zeppelin Code Analyzer
- ❖ Solidity Code Compiler

# Risk Classification

Smart contracts are generally designed to manipulate and hold funds denominated in ETH/BNB. This makes them very tempting attack targets, as a successful attack may allow the attacker to directly steal funds from the contract. Below are the typical risk levels of a smart contract:

**Vulnerable:** A contract is vulnerable if it has been flagged by a static analysis tool as such. As we will see later, this means that some contracts may be vulnerable because of a false positive.

**Exploitable:** A contract is exploitable if it is vulnerable and the vulnerability could be exploited by an external attacker. For example, if the “vulnerability” flagged by a tool is in a function that requires owning the contract, it would be vulnerable but not exploitable.

**Exploited:** A contract is exploited if it received a transaction on the main network which triggered one of its vulnerabilities. Therefore, a contract can be vulnerable or even exploitable without having been exploited.

## Smart Contract Security Audit

Risk severity	Meaning
<b>! High</b>	This level vulnerabilities could be exploited easily and can lead to asset loss, data loss, asset, or data manipulation. They should be fixed right away.
<b>! Medium</b>	This level vulnerabilities are hard to exploit but very important to fix, they carry an elevated risk of smart contract manipulation, which can lead to high-risk severity
<b>! Low</b>	This level vulnerabilities should be fixed, as they carry an inherent risk of future exploits, and hacks which may or may not impact the smart contract execution.
<b>! Informational</b>	This level vulnerabilities can be ignored. They are code style violations and informational statements in the code. They may not affect the smart contract execution

# Static Analysis

## Smart Contract Security Audit

# Manual Analysis

Function	Description	Tested	Verdict
<b>Total Supply</b>	provides information about the total token supply	Yes	<b>Passed</b>
<b>Balance Of</b>	provides account balance of the owner's account	Yes	<b>Passed</b>
<b>Transfer</b>	executes transfers of a specified number of tokens to a specified address	Yes	<b>Passed</b>
<b>Approve</b>	allow a spender to withdraw a set number of tokens from a specified account	Yes	<b>Passed</b>
<b>Allowance</b>	returns a set number of tokens from a spender to the owner	Yes	<b>Passed</b>
<b>Buy Back</b>	is an action in which the project buys back its tokens from the existing holders usually at a market price	NA	NA
<b>Burn</b>	executes transfers of a specified number of tokens to a burn address	NA	NA
<b>Mint</b>	executes the creation of a specified number of tokens and adds it to the total supply	NA	NA
<b>Rebase</b>	circulating token supply adjusts (increases or decreases) automatically according to a token's price fluctuations	NA	NA
<b>Blacklist</b>	stops specified wallets from interacting with the smart contract function modules	Yes	<b>! Low</b>
<b>Lock</b>	stops or locks all function modules of the smart contract	NA	NA

Function	Description	Tested	Verdict
<b>Dividend</b>	executes transfers of a specified dividend token to a specified address	Yes	<b>Passed</b>
<b>Airdrop</b>	executes transfers of a specified number of tokens to a specified address	Yes	<b>Passed</b>
<b>Max Transaction</b>	a non-whitelisted wallet can only transfer a specified number of tokens	Yes	<b>! Low</b>
<b>Max Wallet</b>	a non-whitelisted wallet can only hold a specified number of tokens	Yes	<b>! Low</b>
<b>Cooldown Timer</b>	functionality to limit the number of transactions that a wallet can make within 24-hours	Yes	<b>! Low</b>
<b>Anti Bot</b>	stops some or all bot wallets from interacting with the smart contract	NA	NA
<b>Anti Snipe</b>	prevents bots from making transaction at "addLiquidity" block	NA	NA
<b>Transfer Ownership</b>	executes transfer of contract ownership to a specified wallet	Yes	<b>Passed</b>
<b>Renounce Ownership</b>	executes transfer of contract ownership to a dead address	Yes	<b>Passed</b>

## Best Practices

- ❖ Owner cannot mint tokens after initial contract creation/deployment.
- ❖ The smart contract utilizes "SafeMath" function to avoid common smart contract vulnerabilities.

```
string private _name = "MetaStellar";
library SafeMath {
function add(uint256 a, uint256 b) internal pure returns (uint256) {
    uint256 c = a + b;
    require(c >= a, "SafeMath: addition overflow");

function sub(uint256 a, uint256 b) internal pure returns (uint256) {
    return sub(a, b, "SafeMath: subtraction overflow");

    uint256 c = a * b;
    require(c / a == b, "SafeMath: multiplication overflow");

    return c;

function div(uint256 a, uint256 b) internal pure returns (uint256) {
    return div(a, b, "SafeMath: division by zero");

function mod(uint256 a, uint256 b) internal pure returns (uint256) {
    return mod(a, b, "SafeMath: modulo by zero");
```

## Note

- ❖ Be aware that active smart contract owner privileges constitute an elevated impact to smart contract safety and security.
- ❖ Smart contract owner can **change trading status**, this function module can be used to stop the wallets from buying or selling the assets.
- ❖ Smart contract owner can **explicitly airdrop** tokens to the specified wallet/wallets.
- ❖ Smart contract owner can **blacklist** certain wallets from interacting with the contract function modules.
- ❖ Smart contract owner can **change transaction and transfer fees**. This function module can be used to impose extraordinary transaction fees. No arbitrary limit set.

- ❖ Smart contract owner can **change fee multiplier**. This function module can be used to impose extraordinary transaction fees. No arbitrary limit set.
- ❖ Smart contract owner can **change max transaction and wallet limit**. The smart contract owner can change the value to “zero”. No arbitrary limit set.
- ❖ Smart contract has a **low severity issue** which may or may not create any functional vulnerability.

```
{
  "resource": " /MetaStellar.sol",
  "owner": "_generated_diagnostic_collection_name_#0",
  "severity": 8, (! Low Severity)
  "Expected pragma, import directive or contract/interface/library definition",
  "source": "solc", .....
}
```

<b>Verified</b>	54 functions and instances verified and checked

# Auditor's Verdict

InterFi team has performed a line-by-line manual analysis and automated review of the smart contract. The smart contract was analyzed mainly for common smart contract vulnerabilities, exploits, and manipulation hacks.

- ❖ MetaStellar's smart contract source code has **LOW RISK SEVERITY**
- ❖ MetaStellar's smart contract has an **ACTIVE OWNERSHIP**
- ❖ MetaStellar's smart contract owner has multiple "Write Contract" privileges. Centralization risk correlated to the active owner is **HIGH**

# InterFi

## Note for stakeholders

- .....
- ❖ Be aware that active smart contract owner privileges constitute an elevated impact on smart contract safety and security.
  - ❖ If the smart contract is not deployed on any blockchain at the time of the audit, the contract can be modified or altered before blockchain development. Verify contract's deployment status in the audit report.
  - ❖ Make sure that the project team's KYC/identity is verified by an independent firm.
  - ❖ Always check if the contract's liquidity is locked. A longer liquidity lock plays an important role in the project's longevity. It is recommended to have multiple liquidity providers.
  - ❖ Examine the unlocked token supply in the owner, developer, or team's private wallets. Understand the project's tokenomics, and make sure the tokens outside of the LP Pair are vested or locked for a longer period.
  - ❖ Ensure that the project's official website is hosted on a trusted platform, and is using an active SSL certificate. The website's domain should be registered for a longer period.

# Important Disclaimer

InterFi Network provides contract development, testing, auditing and project evaluation services for blockchain projects. The purpose of the audit is to analyze the on-chain smart contract source code and to provide a basic overview of the project. **This report should not be transmitted, disclosed, referred to, or relied upon by any person for any purpose without InterFi's prior written consent.**

InterFi provides the easy-to-understand assessment of the project, and the smart contract (otherwise known as the source code). The audit makes no statements or warranties on the security of the code. It also cannot be considered as enough assessment regarding the utility and safety of the code, bug-free status, or any other statements of the contract. While we have used all the data at our disposal to provide the transparent analysis, it is important to note that you should not rely on this report only – we recommend proceeding with several independent audits and a public bug bounty program to ensure the security of smart contracts. **Be aware that smart contracts deployed on a blockchain aren't resistant to external vulnerability, or a hack. Be aware that active smart contract owner privileges constitute an elevated impact on smart contract safety and security. Therefore, InterFi does not guarantee the explicit security of the audited smart contract.**

The analysis of the security is purely based on the smart contracts alone. No applications or operations were reviewed for security. No product code has been reviewed.

**This report should not be considered as an endorsement or disapproval of any project or team.**

The information provided in this report does not constitute investment advice, financial advice, trading advice, or any other sort of advice and you should not treat any of the report's content as such. Do conduct your due diligence and consult your financial advisor before making any investment decisions.

# About InterFi Network

InterFi Network provides intelligent blockchain solutions. InterFi is developing an ecosystem that is seamless and responsive. Some of our services: Blockchain Security, Token Launchpad, NFT Marketplace, etc. **InterFi's mission is to interconnect multiple services like Blockchain Security, DeFi, Gaming, and Marketplace under one ecosystem that is seamless, multi-chain compatible, scalable, secure, fast, responsive, and easy to use.**

InterFi is built by a decentralized team of UI experts, contributors, engineers, and enthusiasts from all over the world. Our team currently consists of 6+ core team members, and 10+ casual contributors. **InterFi provides manual, static, and automatic smart contract analysis, to ensure that project is checked against known attacks and potential vulnerabilities.**
