Audit Check (Mandatory) Static, Software, Auto Intelligent & Manual Analysis

Project Check (Optional) KYC, Website & Socials Analysis (Not Applicable)

Consultation Request Date October 03, 2021

Report Date October 11, 2021

Audit Summary

InterFi team has performed a line-by-line manual analysis and automated review of the smart contract. The smart contract was analyzed mainly for common smart contract vulnerabilities, exploits, and manipulation hacks. According to the smart contract audit:

- Day Of Defeat's smart contract source codes has LOW RISK SEVERITY.
- Day Of Defeat has successfully PASSED the smart contract audit.

For the detailed understanding of risk severity, source code vulnerability, and functional test, kindly refer to the audit.

Project Overview

InterFi was consulted by Day of Defeat on October 03, 2021 to conduct a smart contract security audit of their token source code.

DOD (Day of Defeat) is a token issued on the Binance Smart Chain. It is first and exciting social experiment on this planet, with a radical deflationary mathematical model which will keep the price of DOD token rising continuously. The team of DOD has fixed the first and final price in the smart contract mathematically. Therefore, all final holders will get 2,300,000X gains.

A prize fund pool will be controlled by the smart contract. At the end of project, the prize fund pool will reach 100,000,000 BUSD while 1,000,000,000 DOD token left. At that point, all token holders can swap their DOD for BUSD at the rate 1 DOD = 0.1 BUSD. Therefore, the project will be able to deliver projected 2,300,000X gains.

Smart Contract Security Audit

Audit Scope & Methodology

The scope of this report is to audit the smart contract source code of Day of Defeat. The source code can be viewed in its entirety on

https://github.com/interfinetwork/audited-codes/blob/main/DayOfDefeat.sol

InterFi has scanned the contract and reviewed the project for common vulnerabilities, exploits, hacks, and back-doors. Below is the list of commonly known smart contract vulnerabilities, exploits, and hacks:

Category

Re-entrancy (RE)

Unhandled Exceptions (UE)

Transaction Order Dependency (TO)

Integer Overflow (IO)

Unrestricted Action (UA)

Ownership Takeover

Gas Limit and Loops

Deployment Consistency

Repository Consistency

Data Consistency

Token Supply Manipulation

Access Control and Authorization

Operations Trail and Event Generation

Assets Manipulation

Liquidity Access

Source Code Review

Smart Contract Vulnerabilities

Functional Assessment

InterFi's Echelon Audit Standard

The aim of InterFi's "Echelon" standard is to analyze the smart contract and identify the vulnerabilities and the hacks in the smart contract. Mentioned are the steps used by ECHELON-1 to assess the smart contract:

- Solidity smart contract source code reviewal:
 - Review of the specifications, sources, and instructions provided to InterFi to make sure we understand the size, scope, and functionality of the smart contract.
 - Manual review of code, which is the process of reading source code line-byline to identify potential vulnerabilities.
- 2. Static, Manual, and Automated Al analysis:
 - Test coverage analysis, which is the process of determining whether the test cases are covering the code and how much code is exercised when we run those test cases.
 - Symbolic execution, which is analysing a program to determine what inputs causes each part of a program to execute.
- 3. Best practices review, which is a review of the smart contracts to improve efficiency, effectiveness, clarify, maintainability, security, and control based on the established industry and academic practices, recommendations, and research.
- 4. Specific, itemized, actionable recommendations to help you take steps to secure your smart contracts

Automated 3P frameworks used to assess the smart contract vulnerabilities

- Slither
- Consensys MythX
- Consensys Surya
- Open Zeppelin Code Analyzer
- Solidity Code Complier

InterFi's Risk Classification

Smart contracts are generally designed to manipulate and hold funds denominated in ETH/BNB. This makes them very tempting attack targets, as a successful attack may allow the attacker to directly steal funds from the contract. Below are the typical risk levels of a smart contract:

Vulnerable: A contract is vulnerable if it has been flagged by a static analysis tool as such. As we will see later, this means that some contracts may be vulnerable because of a false-positive.

Exploitable: A contract is exploitable if it is vulnerable and the vulnerability could be exploited by an external attacker. For example, if the "vulnerability" flagged by a tool is in a function which requires to own the contract, it would be vulnerable but not exploitable.

Exploited: A contract is exploited if it received a transaction on the main network which triggered one of its vulnerabilities. Therefore, a contract can be vulnerable or even exploitable without having been exploited.

		SHRUL COHLIGGE
Risk severity	Meaning	Security Audit
! Critical	This level vulner	abilities could be exploited easily, and can lead to asset loss, data
	loss, asset mani	pulation, or data manipulation. They should be fixed right away.
! High	This level vulner	abilities are hard to exploit but very important to fix, they carry an
	elevated risk of s	smart contract manipulation, which can lead to critical risk severity
! Medium	This level vulner	abilities are should be fixed, as they carry an inherent risk of future
	exploits, and had	cks which may or may not impact the smart contract execution.
	This level vulne	erabilities can be ignored. They are code style violations, and
! Low	informational st	catements in the code. They may not affect the smart contract
	execution

Verified

Active smart contract owner privileges constitute an elevated impact to smart contract's safety and security.

- Active Owner: 0x98ac817934eb66de820bfac7fc7b478b69d6895d
- Owner can mint tokens at token launch.
- Owner can-not lock or burn user assets.
- Owner uses "takeOutTokenInCase" function. According to the project team, this token will be utilized only if there's any remaining BUSD left in the fund pool at the end of the project.

Important Information

Day of Defeat smart contract utilizes the "SafeMath" to prevent known vulnerabilities.

```
string private _name = 'Day Of Defeat';
    string private _symbol = 'DOD';
    uint8 private _decimals = 18;

library SafeMath {
    function add(uint256 a, uint256 b) internal pure returns (uint256) {
        uint256 c = a + b;
        require(c >= a, 'SafeMath: addition overflow');

    return c;
}

function sub(uint256 a, uint256 b) internal pure returns (uint256) {
    return sub(a, b, 'SafeMath: subtraction overflow');
}

uint256 c = a * b;
    require(c / a == b, 'SafeMath: multiplication overflow');

return c;
}
```

Smart Contract

Day of Defeat uses "takeOutTokenInCase" function. According to the project team, this token will be utilized only if there's any remaining BUSD left in the fund pool at the end of the project.

```
function takeOutTokenInCase(address _token, uint256 _amount, address _to) public onlyOwner {
    require(!isLocked, "Token contract is locked");
    IBEP20(_token).transfer(_to, _amount);
}
```

Day of Defeat smart contract has 1 low severity issues which may or may not create any functional vulnerability.

Auditor's Verdict

InterFi team has performed a line-by-line manual analysis and automated review of the smart contract. The smart contract was analyzed mainly for common smart contract vulnerabilities, exploits, and manipulation hacks.

Day Of Defeat's token smart contract source code has LOW RISK SEVERITY.

Day Of Defeat has successfully PASSED the smart contract audit.

General Note:

- Be aware that active smart contract owner privileges constitute an elevated impact to smart contract's safety and security.
- Owner or developer KYC isn't checked and verified due to out of scope.
- Project's liquidity pair isn't checked and verified due to out of scope.
- Project website is not checked due to out of scope. The website hasn't been reviewed for SSL and lighthouse report.

Important Disclaimer

InterFi Network provides contract auditing and project verification services for blockchain projects. The purpose of the audit is to analyse the on-chain smart contract source code, and to provide basic overview of the project. This report should not be transmitted, disclosed, referred to, or relied upon by any person for any purposes without InterFi's prior written consent.

InterFi provides the easy-to-understand assessment of the project, and the smart contract (otherwise known as the source code). The audit makes no statements or warranties on the security of the code. It also cannot be considered as an enough assessment regarding the utility and safety of the code, bug-free status, or any other statements of the contract. While we have used all the data at our disposal to provide the transparent analysis, it is important to note that you should not rely on this report only — we recommend proceeding with several independent audits and a public bug bounty program to ensure the security of smart contracts. Be aware that smart contracts deployed on a blockchain aren't resistant from external vulnerability, or a hack. Be aware that active smart contract owner privileges constitute an elevated impact to smart contract's safety and security. Therefore, InterFi does not guarantee the explicit security of the audited smart contract.

The analysis of the security is purely based on the smart contracts alone. No applications or operations were reviewed for security. No product code has been reviewed.

This report should not be considered as an endorsement or disapproval of any project or team.

The information provided on this report does not constitute investment advice, financial advice, trading advice, or any other sort of advice and you should not treat any of the report's content as such. Do conduct your own due diligence and consult your financial advisor before making any investment decisions.

About InterFi Network

InterFi Network provides intelligent blockchain solutions. InterFi is developing an ecosystem that is seamless and responsive. Some of our services: Blockchain Security, Token Launchpad, NFT Marketplace, etc. InterFi's mission is to interconnect multiple services like Blockchain Security, DeFi, Gaming, and Marketplace under one ecosystem that is seamless, multi-chain compatible, scalable, secure, fast, responsive, and easy-to-use.

InterFi is built by a decentralized team of UI experts, contributors, engineers, and enthusiasts from all over the world. Our team currently consists of 6+ core team members, and 10+ casual contributors. InterFi provides manual, static, and automatic smart contract analysis, to ensure that project is checked against known attacks and potential vulnerabilities.
